

Staybright (COSD35) Slow Darkening Pinto

Staybright, originally trialed as COSD 35, is a slow darkening pinto bean with high yield potential. It is resistant (small pustule response) to the prevalent races of dry bean rust in Colorado and resistant to the NL3 strain of Bean Common Mosaic Virus. Staybright has a medium - late harvest maturity (95 - 97 days) and an upright architecture (Type II, CIAT classification) suitable for direct harvest. The average seed size is 1150 – 1250 seeds/lb. The slow darkening trait helps to maintain a bright seed coat over time.
